

Paste Multiple Keyframes Instructions

This script will let you copy and paste keyframes from multiple layers at the same time.

Interface:

Instructional Video:

<http://www.youtube.com/watch?v=qagiLUztEiY>

To use:

1. Select all the keyframes you want to copy
2. Move your time slider to where you want the first keyframe to be placed
3. Click on Paste

Do not copy checkbox:

This is an option useful if:

1. You have lots and lots of keyframes (100's or 1000's on an individual layer)
2. The keyframes you are pasting will be in the **MIDDLE** of pre-existing keyframes on their respective layers

By checking this box, two things will happen when you paste your keyframes

1. The keyframes will paste much, much faster
2. You will **NOT** paste any easing/temporal/spatial properties with your keyframes (This option is mainly for when you have lots of keyframes from tracking, motion capture, etc. and the keyframe interpolation is not necessary)

Running without an interface:

If you have installed the script to run without an interface (such as using it with ft-Toolbar), it will default to copying/pasting all easing/temporal/spatial properties.

Known issues

- This script can not work with plugins or effects that have custom values for keyframes. ex. (Levels - Histogram, Hue/Saturation - Channel Range, etc.)

Revision History

Version 1.0

Initial Release

Version 1.1

Added support for ft-toolkit

Version 1.2

Now copies and pastes keyframe interpolation (spatial and temporal)

Version 1.3

Work around for scripting language bug getting/setting value for mask shape tangents

Version 1.4

Wrapped entire script in a function

Version 1.5

Speed improvements - especially if you have a lot of keyframes on a layer

Version 1.6

Even more speed improvements! - if your new keyframes are going to be pasted before or after ALL of the pre-existing keyframes on their respective layers
