

Film Fix Mac Update

Welcome

Film Fix is a plug-in set designed for Adobe After Effects and Mac OS X. Film Fix lets you remove unwanted artifacts from digital media transferred from film. The previous version was available only on Windows XP. The current manual covers the Windows version but the features are identical on Mac OS X.

Film Fix comes packaged as complete software installer. You must have installed Adobe After Effects 6.0 or later (including After Effects 7.0) before installing Film Fix. The installer will automatically place the required components on your hard drive.

Film Fix will NOT run in other host After Effects-compatible applications.

The installer will guide you through the process of installing the plug-in. You will be prompted for a serial number on installation of Film Fix.

Activation

The final step in the installation before placing the plug-in on your system is activating the plug-in. YOU MUST ENTER A SERIAL NUMBER TO USE Film Fix for After Effects. Your serial number is provided in email form automatically when you purchase the product as a download. You may also find the serial number clearly applied to the outside of the Film Fix package if you purchase a box product.

The serial number for Film Fix appears in the following format:

####

All the characters are numbers. You must enter all numbers in the serial number entry dialog before the installation can proceed. Once completed, you can start After Effects and begin using Film Fix.
